My artifact is a full stack web development project for the CS-465 course. This project was created in October 2025 and completed in November 2025. The project's original scenario was that one was hired by a company called "Travlr Getaways" to create a website on their behalf. I chose this artifact for my ePortfolio because it showcases all three important aspects of writing a great application: databases (i.e. storing information about destinations, food, and rooms), algorithms and data structure (i.e. the search bar), and software design and engineering (i.e. writing code that is easy-to-read, well-commented, and written with security in mind). Additionally, this project is well-suited to my career aspirations, as I would like to get into web development.

Currently, the artifact was improved by changing the file structure and adding the source code required for the login page for administrators to gain access to the database. This should give admins the ability to add, delete, and edit the data that contains destination information. However, I still have to fix the directories that my source code uses to access the data and load the website's contents, because when I made attempts to start the application to add test information through Postman, I got this error (photo at the bottom). Furthermore, I have not yet added the SSL/TLS certificate required to further secure the application and convert the website from HTTP to HTTPS, so I will be continuing to work towards that goal.
